

Why choose Douglas Environmental Services?

Cost Cutting

- Instead of the traditional pieces such as provision of topsoil, spreading topsoil, ameliorating, mixing, then hydromulching, we work with suppliers that can give a single solution to the whole process at a fraction of the total cost.

Locally Based

- We are locally based, which means more convenience and cost cutting for clients rather than contracting overseas based agents.

National Staffs

John Douglas (Manager)
40 years environmental experience (20 years, PNG) *"Always willing and happy to provide experience and opportunities for young Professionals in Papua New Guinea"*

Basen Samadari (Environmental Consultant)
UPNG – BSc Environmental Science
8 years work experience as environmental scientist. *"Douglas Environmental Services is the premier environmental Service provider in PNG"*

John Lano (Technical Officer)
5 years work experience technical officer with Douglas Environmental Services. *"Happy to provide environmental services to fellow PNGans for a better, safer PNG"*

Ellie Paon (Senior Environmental Officer)
4 years work experience with Douglas Environmental Services. *"DES offers real challenges and learning opportunities for young environmental professionals"*

Douglas Environmental Services

Douglas Environmental Services was established in 1999 to provide environmental services for developers throughout PNG.

We are based in Port Moresby.

Our Main Activities Include:

- Environmental Permitting and related field surveys, physical, biological and social areas
- Natural Resources / Development constraints
- Soil Excavation technologies

What is Hydromulching?

Hydromulching is a technical innovation that was introduced into New Zealand in the 1970's. Since that time, it has been refined and is now practiced in New Zealand Australia and most recently in Papua New Guinea (and much of the rest of the world). The most basic description of hydromulching is the application of grass and other plant seed, fertilizers, binding agents (glue) and vegetable fiber (mulch) by spray pump from a mobile vehicle.

Why Hydromulching?

Today Hydromulching is used to stylize major earthworks when there is concern about silt making watercourses. Examples include Roadwork's; frequent uses include subdivision developers and road makers.

Hydromulching is the best outcome for companies from a complete environmental viewpoint.

- It is a very effective measure for erosion prevention and control by wind and rain.
- Soil stabilization
- Rapid re-vegetation
- Satisfying the increasing legal liability for the land to be restored to a natural state.

Hydromulching can also be used to grow grass for residential lawns, parks, walkways and playing fields.

Range of Services Include;

HYDROMULCHING

The hydraulic application of seed, fibre, fertilizer, binders, growth promotants and cosmetic agents. The seed may be grass or native woody species.

HYDROSEEDING

The hydraulic application of seed.

DIRECT SEEDING

Seedbed preparation, seeding, fertilization and crimp rolling.

HYROSEALING

The hydraulic application of binding agents with or without fibre for ground stabilization.

GROUND STABILISATION

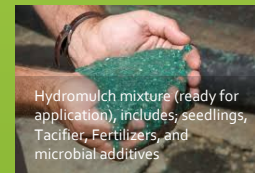

The application of specialized stabilization products.

TURFING

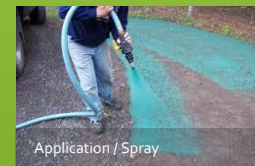

Provision and laying of standard rolls and slabs of turf.

Current mulch being used made of straw fibers

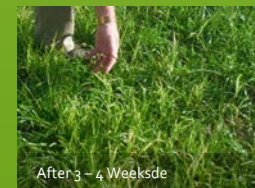

Hydromulch mixture (ready for application), includes; seedlings, Tacifier, Fertilizers, and microbial additives

Application / Spray
